Secretary

Gracy R. Danois, Acting Chief  
Water Quality Planning  
U.S. Environmental Protection Agency  
Region 4 Atlanta Federal Center  
61 Forsyth Street  
Atlanta, GA 30303-8960

Dear Ms. Danois:

Florida's statewide total maximum daily load (TMDL) for mercury applies to all fresh and marine waters in the state. The Florida Department of Environmental Protection (department) Division of Environmental Assessment and Restoration (division) adopted the TMDL in June 2013. The TMDL sets a statewide wasteload allocation of 23 kilograms per year (kg/yr) for total mercury for all industrial and domestic wastewater sources holding National Pollutant Discharge Elimination System (NPDES) permits in Florida, other than most municipal separate storm sewer system (MS4) permits. The statewide mercury TMDL assumes that most of the mercury impacting Florida waterbodies comes from uniform, diffuse atmospheric deposition. At the time of TMDL development, the division, with significant assistance from contractors, universities, and the department's Division of Air Resource Management, performed atmospheric dispersion and deposition modeling to confirm this assumption.

The statewide TMDL applies to "all fresh and marine waters in Florida" as per Rule 62-304.900, Florida Administrative Code (F.A.C.). At the time of its adoption, the department had verified a specific list of 1,132 fresh and marine waters as impaired for mercury (in fish tissue) through implementing the Impaired Waters Rule (IWR, Chapter 62-303, F.A.C.). The EPA formally approved the TMDL for this list of 1,132 waters. The department performed additional analyses in July 2017, and on November 29, 2017, EPA approved the addition of 25 WBIDs to the list of specific waters addressed by the statewide mercury TMDL. These additional waters were verified as impaired for mercury (in fish tissue).

The purpose of this letter is to update the July 2017 analysis and request the addition of 367 WBIDs to the mercury TMDL. When the division confirms new mercury impairments in subsequent assessment cycles, the statewide mercury TMDL also applies and the waters can be listed in category 4a (TMDL Complete) if the main assumptions used in the development of the statewide TMDL remain applicable. To make this determination, the division searches through its air and wastewater permit databases to

identify whether any new point sources of mercury could be impacting a specific waterbody. If there are no nearby, discrete point sources of mercury, then the assumption about a uniform, diffuse source of mercury is confirmed, and the water can be included under the statewide TMDL. If there is a new, nearby point source, then additional study is warranted to determine whether the statewide mercury TMDL can apply or whether a site-specific mercury TMDL needs to be developed.

Division of Air Resource Management permitting staff provided information on new or expanded point sources of mercury air emissions since March 2017, which was the cutoff used in DEP's July 2017 TMDL update. The 2017 TMDL update concluded that, since TMDL adoption through March 2017, (1) no existing air point sources had increased their permitted mercury air emissions, and (2) all point sources of mercury air emissions had been included in the TMDL atmospheric deposition modeling conducted. Since 2017 no existing point sources of air emissions has had modifications to increase their permitted mercury emission rates. Additionally, there is one new permitted source of mercury air emissions. Nucor Steel, Inc commenced operation in January 2021, in Frostproof, Florida. The facility is within 10 km of one mercury (in fish tissue) impaired waterbody, Lake Lotela (WBID 1813B). Local deposition from this air point source may have a direct impact on Lake Lotela. The lake was listed for mercury (in fish tissue) during Cycle 3 Group 4 based on data collected in 2014. The listing decision and fish tissue data predate the operation of the Nucor facility; therefore, the department believes that the waterbody (WBID 1813B) should remain in category 4a pending additional evaluation. However, DEP will evaluate emissions from the new facility to determine whether they contribute to additional water quality degradation not addressed by the TMDL. Additionally, DEP will work with the Florida Fish and Wildlife Conservation Commission to collect additional fish tissue data from Lake Lotela to determine if the lake is still impaired for mercury. These actions will be completed by the next biennial assessment. DEP requests that WBID 1813B remain in category 4a pending reanalysis of the applicability of the TMDL by 2024.

Division of Water Resource Management permitting staff were consulted to identify discharge and mercury monitoring results for wastewater facilities that have mercury monitoring requirements from 2017-2021. The permit data were compared to previously accumulated data (2009-2016) to search for new mercury dischargers or any facilities starting new mercury monitoring of their discharge. The data analyses answered the following questions: Are there any new dischargers? For existing dischargers, are there any that show an increasing trend of discharge? Do any facilities show new mercury monitoring results, and if so, why do their permits include new mercury monitoring requirements?

No new dischargers were identified. There were NPDES facilities with new mercury monitoring (seven industrial stormwater facilities, six domestic wastewater facilities, seven industrial wastewater facilities, and one power plant wastewater facility). All the stormwater discharges are intermittent with insignificant amounts of mercury because the discharges are related to rainfall events. According to permit documents, all domestic,

industrial, and power plant wastewater facilities initiated mercury monitoring to address the requirement of the TMDL.

Department staff conducted the required confirmational analysis for WBIDs verified as impaired for mercury (in fish tissue) since 2017 to show that the wastewater discharge condition used to establish the wasteload allocation (WLA) for the statewide mercury TMDL still apply. Staff reviewed discharge and mercury monitoring results for wastewater facilities that have mercury monitoring requirements and concluded that the assumptions made by the mercury TMDL still hold. All newly identified mercury impaired waters are therefore addressed by the statewide mercury TMDL and can be placed into the 4a category. DEP will conduct additional study in WBID 1813B to determine whether the findings of the Cycle 3 Group listing action still hold. DEP will conduct this study during the next Biennial Assessment period.

The department requests that EPA approve the following waters listed in **Table 1** as additions to the list of specific waters addressed by the statewide mercury TMDL for which the above demonstration shows that the assumptions of the TMDL still hold. DEP will add the WBIDs listed in **Table 1** to [Appendix B](#) of the Mercury TMDL for the State of Florida upon EPA's approval of this action. Additionally, we request that EPA approve placing the waterbodies listed in **Table 1** in Category 4a.

If you have any comments or questions about our analysis and requested action, please contact me at (850) 245-8414.

Sincerely,

A handwritten signature in cursive script, appearing to read 'Ken Weaver', written in dark ink.

**Table 1. List of additional Florida Waterbodies verified as impaired for mercury (in fish tissue).** The list included WBIDS from the Group 1, Cycle to Group 2, Cycle 4 of the basin rotation.

**Note: Conditions Causing the New Listing:**

Waterbody Type Change – new information or water quality data were used to more accurately assess the waterbody.

WBID Resegmentation – new information or water quality data were used to more accurately redraw the WBID boundaries, which resulted in new WBIDs being created.

Meets Data Sufficiency – new information or water quality data were available to assess the waterbody.

Omission – waterbodies that were omitted at the time of the basin assessment were identified.

Readoption - G1C3 EPA Decision Document – 51 waters were placed into category 4a for the Group 1, Cycle 3 (G1C3) adoption; however, they were not properly noticed through the impaired waters listing process. These waters were subsequently noticed in the Group 1, Cycle 4 basin assessment.
